

Max WLX™ Feedback from the Field

Max Associates are enthusiastically testing Max WLX and reporting back to Corporate their successes and some questions as well. Here are some questions and answers that may be of help to you as more and more people decide to succeed once and for all with weight loss.

Q: Do I have to take Max WLX exactly one-half hour before eating my two largest meals?

A: Remember that Max WLX has two actions. The first is that when taken a half-hour before the two largest meals, it curbs appetite. The polysaccharides in the formula (derived from the acacia tree) increase in volume making it easier for you to feel full and quit eating. The second action is that the formula lowers leptin levels. So even if you forget to take it a half-hour before your dinner, for instance, you still need to get two servings a day.

This is where knowing your own body well comes in!

- Some of us can take it WITH dinner and know we've gotten our two servings in for the day.
- But some of us have found that taking Max WLX just before or with dinner will leave us feeling bloated and uncomfortable. You may have to do a little trial and error to see what works for you. If you have to, wait until after your dinner has digested a little and then take the last serving.

Q: If I find it difficult to take capsules, can I open the capsule and take the powder in water?

A: Remember how the Max WLX formula increases in volume in the stomach to help curb appetite? It will start to do that when it comes in contact with water. So do not open the capsules into a glass of water. The capsule is not only a way to contain a serving of Max WLX, it is the means to deliver the formula to the stomach before starting to increase in volume.

Q: I understand that the capsule is gelatin and not from a vegetarian source. But is the formula of Max WLX vegetarian?

A: The polysaccharides in the Max WLX formula are from the acacia tree. However, the fatty acids are animal derived. We regret this will cause problems for our vegan and vegetarian friends, but we have to work with the formula developed at the University of Minnesota.

Q: Once I have reached my weight goal, should I keep taking Max WLX to maintain this loss?

A: The University of Connecticut study did not address follow-up. Max International is grateful for Associate feedback. Please see "Staying on Track" in this newsletter to read what Dr. Gary Fink has found with his patients regarding weight maintenance.

Q: How can I share my success and experience using Max WLX?

A: Please email your success stories to Karen@maxgxl.com.
